Windows Client - Update Cycle

1. How does it works?

ADR (Automatic Deployment Rule) automatically approves **Critical and Security updates** for Windows 7 - 8 - 8.1 - 10, Office, Skype, etc

When the deadline is reached, updates will be **downloaded**

What is Windows Automatic Update Service?

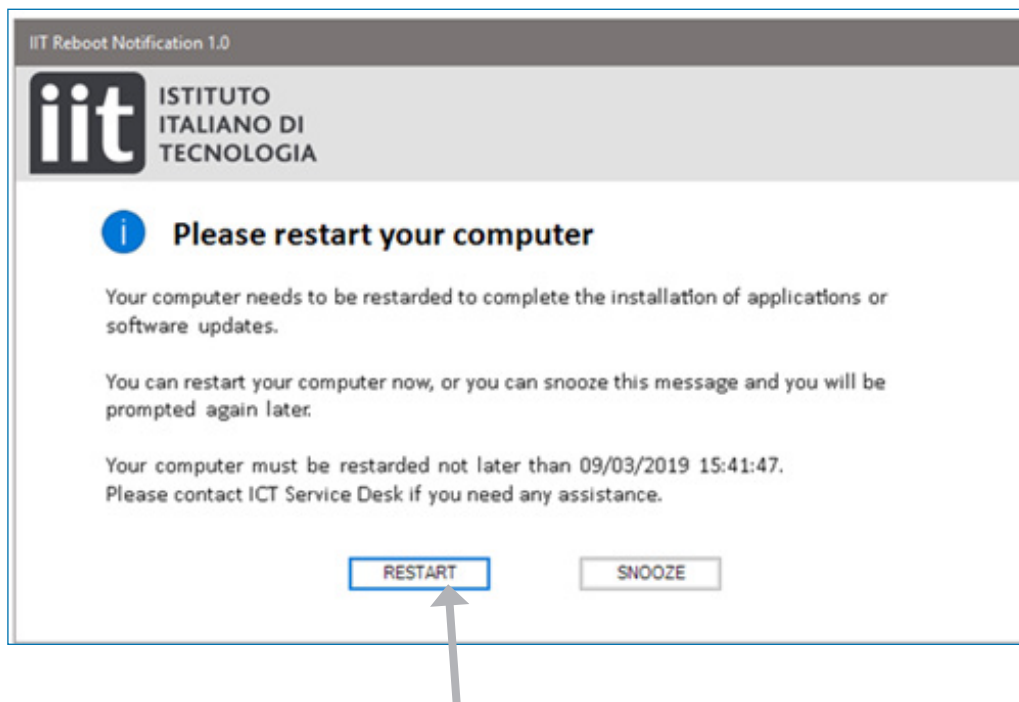

To stay protected against cyber-attacks and malicious threats, it is **very important** that you keep your computers **patched with the latest software updates**.

The **Windows Automatic Update Service** enables users to utilize **Microsoft's Automatic Update** feature with a more conservative selection of patches - focused on critical security updates - than those available directly from Microsoft.

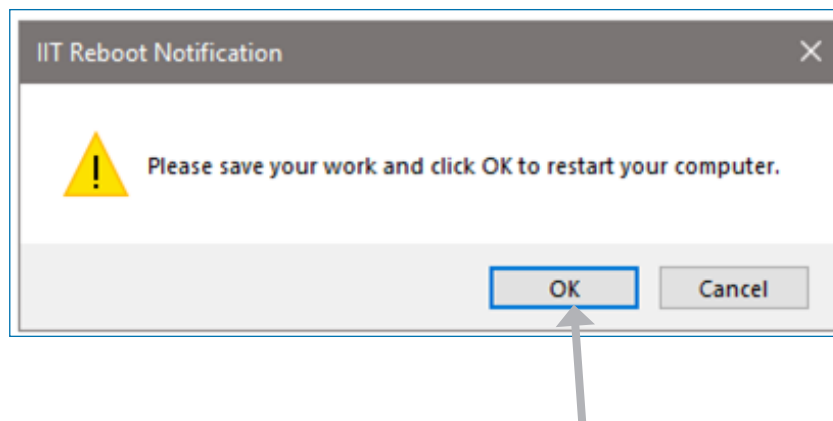

You can find more about Windows Update Lifecycle [following this link](#).

2. Operational guide

When a computer restart is required, a popup will appear as shown below:

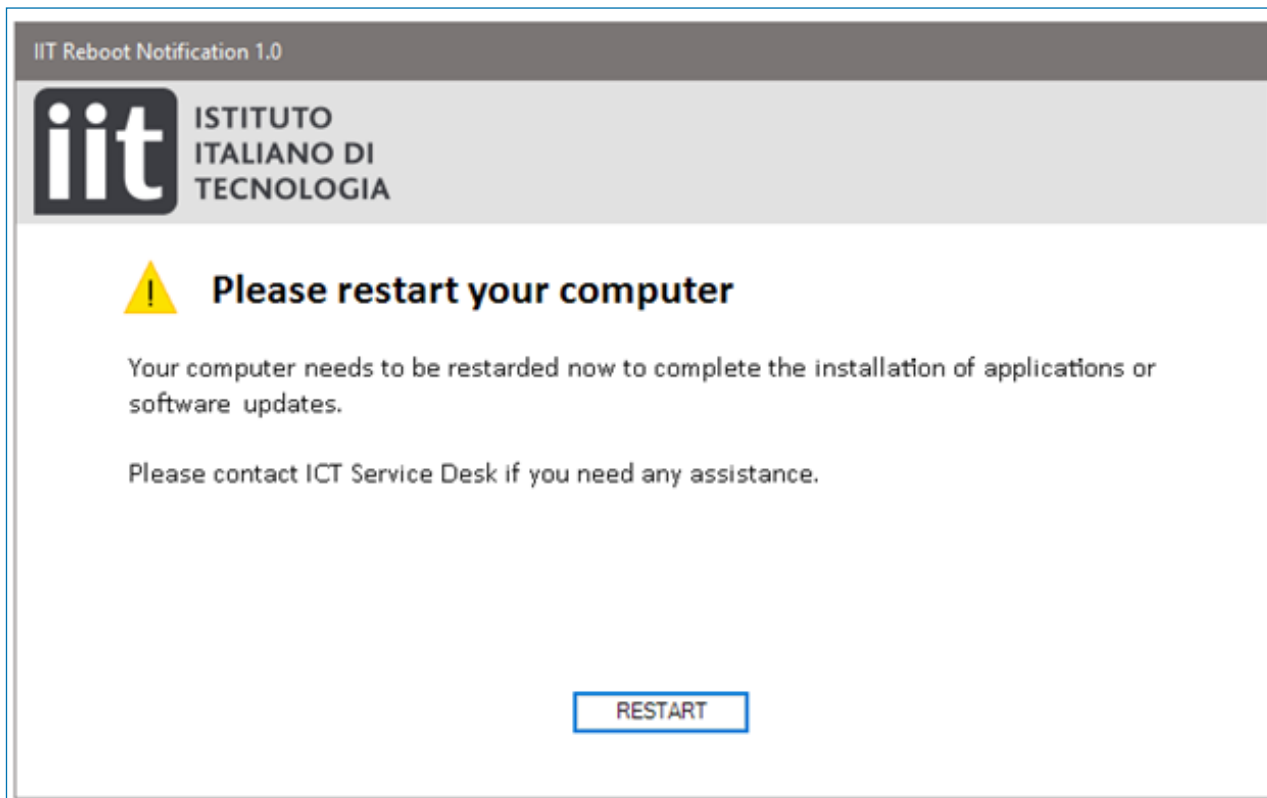

It will be possible to restart immediately by clicking on the **RESTART** button and approve the confirmation popup shown below:

Alternatively, you can postpone the restart by clicking the **SNOOZE** button.

In this case the message **will be resubmitted after 6 hours**.

The restart is postponable up to the 8 day limit, after which it will no longer be possible to close the window and **the only possible option will be to restart the computer**:

The software will **never** perform an automatic restart of the computer **without approval**.
